Wastewater Discharge Permit & Environmental Compliance

A worldwide biomedical device manufacturer needed technical expertise in solving a mercury removal problem to meet wastewater discharge compliance standards. Their choice: Goldman Environmental Consultants, Inc. GEC worked with the client to identify and install a reliable batch mercury removal system that met tough discharge limits.

Recently, GEC was again their choice to help obtain a wastewater discharge permit for their newly purchased, larger plant, in a neighboring town. During the permitting process, GEC discovered and highlighted several process improvements to enhance the client's environmental compliance program. These improvements involved

employee re-training, regulatory notifications, and a hazardous waste management program tune-up.

GEC's proactive and comprehensive approach not only accomplished the original goal of obtaining a wastewater permit, but it also added value beyond the initial scope by:

- Identifying opportunities for the client to easily elevate their compliance program to a higher level, and,
- Positioning the client for enduring compliance success, sustaining a good relationship with the regulators.
