Quarry Hills Brownfields Restoration

The Quarry Hills in Quincy, Massachusetts was abandoned dumping grounds and is now a vibrant commercial and residential property anchored by a PGA championship golf club. GEC played a significant role in this extraordinary brownfield restoration which continues today.

Transformation began with an idea to close several municipal landfills using excavate from the Central Artery/Tunnel Project in Boston. This allowed for the investment of both private and public funds that has transformed the area into a living part of Quincy and a regional destination.

GEC performed site development and engineering tasks including environmental

and building permit coordination; environmental and civil engineering site assessments; strategic and remediation planning; design and construction as well as monitoring and inspection services. This unique project brought all of the broad creative abilities of the GEC team into focus

The next phase of the project will complete the closure of several trash filled quarries and numerous piles of debris over 30 acres. GEC is coordinating permitting and design including wetlands, endangered species habitat, solid and hazardous waste, risk assessment, civil and structural design and engineering, stormwater and project management.
